Workplace Safety and Professional Standards

AITS Learning Hub training manual and practice workbook

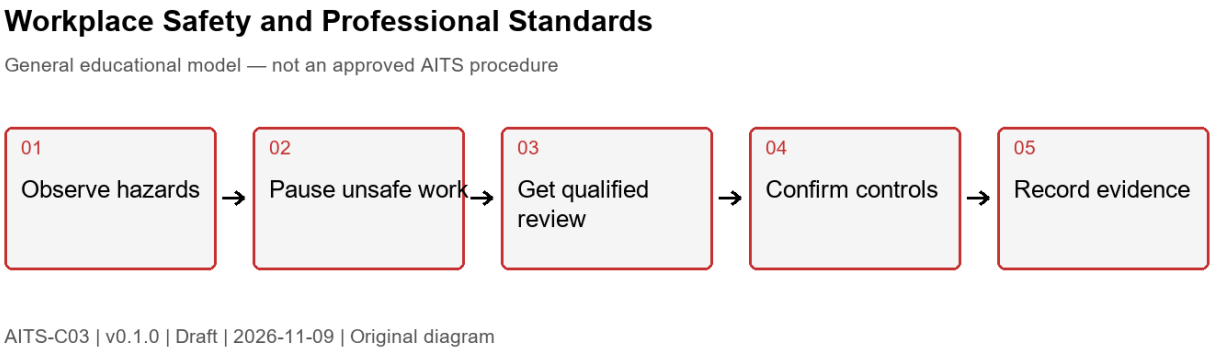

Sample Content — Pending Company Approval

This course introduces the concepts below and gives you exercises to practise them. Use the source notes to distinguish public company information, general guidance and fictional examples. It does not authorize live work or establish internal policy.

Document ID	AITS-C03-MANUAL
Version and status	0.1.0 / Draft
Created and updated	2026-11-09
Audience	All employees, Technician trainees
Reviewer	Company to designate
Author	AI-assisted instructional draft
Classification	Mixed; see lesson references and example labels
Duration	About 100 minutes including exercises
Language	English; Thai summaries pending native-speaker review

Learning objectives

- Identify hazards and select a safe next action.
- Recognize when equipment must be left to qualified personnel.
- Explain why access and rescue planning precede height work.
- Record observations and maintain professional site boundaries.

Recognize hazards before work

AITS-C03-L01 | 15 minutes | Draft

Objective: Identify hazards and select a safe next action.

Prerequisites: AITS-C01

A hazard is a source of possible harm; risk considers how harm could occur and its consequences. Before work, look for damaged cables, wet areas, unstable access, falling objects, traffic, heavy loads and blocked exits. A neat-looking site can still contain hidden services or energized equipment.

Prefer eliminating a hazard or changing the method before relying only on personal protective equipment. A beginner should report an unsafe condition and stay outside the danger area. Do not start an unfamiliar task because a customer says it is urgent. This awareness course does not replace the employer’s risk assessment, task training, supervision or site-specific controls.

Worked example

A loose cable crosses a busy walkway. The exercise asks for a controlled routing solution and communication, not merely a warning shouted once.

Try it

Identify three hazards in a fictional storeroom and propose one safer alternative for each.

Your response: _____

Compare your reasoning

Blocked exit: clear through authorized action. Unstable stack: isolate and request safe restacking. Damaged lead: keep out of service and report.

Remember

Look for the mechanism of harm Remove or reduce exposure Pause when safe controls are missing

Thai summary (AI translation, not professionally reviewed): ระบุอันตรายก่อนเริ่มงาน ลดการสัมผัสความเสี่ยง และหยุดเพื่อขอผู้ควบคุมที่มีความสามารถเมื่อมาตรการไม่พร้อม

Electrical and equipment awareness

AITS-C03-L02 | 15 minutes | Draft

Objective: Recognize when equipment must be left to qualified personnel.

Prerequisites: AITS-C03-L01

Thailand has specific occupational electrical-safety regulations and training requirements; the DLPW reference index links the regulation and notices. A short online lesson is not that qualification. Do not open energized equipment, defeat guards or improvise repairs. Unexpected heat, burning smell, exposed conductors or liquid ingress require a safe stop and qualified assessment.

Network equipment can still be connected to mains supplies, backup power or other energy sources. Switching off one visible switch does not prove all energy is isolated. Isolation, verification and re-energization belong to trained authorized personnel using the approved method. Handle equipment using rated lifting and carrying methods; inspect packaging, connectors and manufacturer instructions without creating exposure.

Worked example

A recorder emits a burning smell. Keep people clear and seek the site emergency/qualified response; do not open the enclosure to inspect it.

Try it

Sort actions into safe observation versus work requiring authorization.

Your response: _____

Compare your reasoning

Safe from a protected location: record model and reported symptom. Requires qualified authorization: opening a mains supply or proving isolation.

Remember

A network device can have hazardous energy Do not improvise electrical repairs Use qualified isolation and verification

Thai summary (AI translation, not professionally reviewed): อุปกรณ์เครือข่ายอาจมีแหล่งพลังงานหลายทาง ห้ามเปิดหรือซ่อมอุปกรณ์ที่มีไฟโดยไม่มีคุณสมบัติและการอนุญาต

References: ELEC, EX. See source register.

Height PPE and handling

AITS-C03-L03 | 15 minutes | Draft

Objective: Explain why access and rescue planning precede height work.

Prerequisites: AITS-C03-L02

Consider whether work can be done from the ground. Where height work remains necessary, competent people must plan suitable access, fall prevention, equipment inspection and emergency arrangements. A harness alone does not make an unsafe setup acceptable. Ladders are not a universal solution, and a chair is not access equipment.

Select PPE for the assessed hazard, correct fit and compatibility. Inspect it and follow its instructions; damaged equipment should not be used. Do not attach fall protection to an unverified anchor. Keep people clear of falling-object areas and use approved handling arrangements. The learner's exercise is a paper planning review; it includes no climbing, lifting experiment or live installation.

Worked example

A camera is above a stairwell. The safe planning response considers another mounting arrangement or properly assessed access, not balancing a ladder on a step.

Try it

List the missing planning information before a fictional high-level camera installation.

Your response: _____

Compare your reasoning

Access method, competent personnel, site assessment, fall prevention, exclusion area, equipment suitability and rescue arrangements.

Remember

Avoid height exposure where possible PPE does not replace planning No climbing in this exercise

Thai summary (AI translation, not professionally reviewed): พิจารณาทำงานจากพื้นก่อน อุปกรณ์ป้องกันส่วนบุคคลไม่ทดแทนการวางแผนทางขึ้น การป้องกันการตก และการช่วยเหลือ

References: HEIGHT, EX. See source register.

Incidents site conduct and quality

AITS-C03-L04 | 15 minutes | Draft

Objective: Record observations and maintain professional site boundaries.

Prerequisites: AITS-C03-L03

If an incident or near miss occurs, protect yourself, seek the designated emergency response and avoid disturbing the scene except where necessary for immediate safety. Do not attempt a rescue beyond your training. Record time, location, observed conditions and witnesses through the verified reporting route. Do not speculate about blame or publish images of people.

At a customer site, confirm access permission, work boundaries and the approved scope. Protect property, keep routes clear and obtain permission before taking evidence photographs. Quality assurance means building reliable checks into the process; final inspection alone cannot repair every planning failure. Record incomplete work and unresolved risks truthfully so that the next person can act.

Worked example

A box falls near a colleague without injury. Treat the near miss as useful safety information rather than hiding it because nobody was hurt.

Try it

Write a four-line near-miss report using fictional facts.

Your response: _____

Compare your reasoning

At 10:20 a loosely stacked box fell in aisle B. No injury observed. Area access was restricted safely. Supervisor review of stacking controls requested.

Remember

Report near misses as well as harm Respect site permissions Record unfinished work honestly

Thai summary (AI translation, not professionally reviewed):
รายงานเหตุเกือบเกิดอุบัติเหตุและข้อบกพร่องตามช่องทางที่ยืนยันแล้ว เคารพพื้นที่ลูกค้าและบันทึกข้อจำกัดตามจริง

Practical scenarios

Burning recorder

Synthetic classroom exercise; not an AITS procedure. Role: Technician trainee

A fictional recorder smells burnt. Its power sources and internal condition are unknown.

Decide: What would you check first, and why? What requires confirmation or authorization? What would you record and hand over?

Appropriate: Keep clear and request qualified site response.

Inappropriate: Open the powered enclosure.

Consequence: Avoiding exposure prevents an observation from becoming an injury.

Camera above stairs

Synthetic classroom exercise; not an AITS procedure. Role: Installation trainee

A customer suggests a chair on a stair to reach a camera. No assessed access method or trained supervisor is present.

Decide: What would you check first, and why? What requires confirmation or authorization? What would you record and hand over?

Appropriate: Pause and request competent access planning.

Inappropriate: Climb because it is a short job.

Consequence: An unsuitable access method can lead to a serious fall.

Falling box near miss

Synthetic classroom exercise; not an AITS procedure. Role: Stores trainee

A box falls without striking anyone. The stack is unstable and the aisle remains in use.

Decide: What would you check first, and why? What requires confirmation or authorization? What would you record and hand over?

Appropriate: Keep clear, arrange safe control and report factual observations.

Inappropriate: Hide the event to avoid delay.

Consequence: Reporting allows the stacking hazard to be addressed.

Use the full scenario JSON for the four-criterion rubric. Score evidence, decision quality, authority/safety and handover from 0–2 each. 0 = absent or unsafe; 1 = partial; 2 = complete and supported. Scores are formative, not certification.

Knowledge check

1. What is a hazard?

A. Any customer complaint | B. A source of possible harm | C. Only a completed injury

2. Which is stronger than relying only on a warning?

A. Removing the trip hazard through a safe approved method | B. Ignoring it | C. Walking faster

3. What should an untrained beginner do with an unsafe task?

A. Try it quickly | B. Ask the customer to hold the ladder | C. Pause and seek qualified supervision

4. Does unplugging one cable prove all energy is isolated?

A. No | B. Always | C. Only for a recorder

5. What is appropriate when a power supply smells burnt?

A. Open it while powered | B. Spray cleaner inside | C. Keep clear and request qualified response

6. What does this awareness lesson provide?

A. Site work authorization | B. Hazard awareness | C. An electrical-work license

Use the answer key after attempting the questions. Proposed practice pass mark: 80%. This is not an AITS competency rule.

Knowledge check continued

7. Does wearing a harness make every anchor suitable?

A. Yes | B. Only indoors | C. No

8. Which is an appropriate training exercise here?

A. Testing an unknown ladder | B. A paper review of missing controls | C. Climbing a chair

9. What should be considered first?

A. Whether the task can be done without height exposure | B. The fastest climb | C. The smallest harness

10. Should a near miss be ignored because no one was hurt?

A. Only if it happened outdoors | B. No | C. Yes

11. Which photograph is appropriate?

A. Authorized evidence with unnecessary personal details excluded | B. Any customer CCTV image | C. A selfie in a restricted room

12. A completion report should disclose unresolved defects.

A. True | B. False

Use the answer key after attempting the questions. Proposed practice pass mark: 80%. This is not an AITS competency rule.

Answer key and references

1. B — A hazard can exist before an incident occurs.

2. A — Reducing exposure is more reliable than a warning alone.

3. C — Awareness is not task competence.

4. A — Backup or other supplies may remain; qualified verification is required.

5. C — Avoid exposure to a possible electrical fault.

6. B — Required task training and authorization remain separate.

7. C — Anchors and the complete system need competent assessment.

8. B — This is awareness training, not supervised practical height training.

9. A — Avoiding the hazard is preferable when practicable.

10. B — It can reveal a control failure before an injury.

11. A — Evidence collection must respect access and privacy boundaries.

12. A — Truthful limitations support safe follow-up.
